Allowable Subject Matter

1. Claims 1-5, 7, 11-13, 18, and 22-25 are allowed.
2. As to claims 1, 11, and 22, Trueblood (U.S. Patent 5,748,189) discloses a display comprising:

at least two display devices (fig. 5, elements 62 and 64), each display device having a display area with a given display resolution wherein the display resolution of at least one display area is different from the display resolution of at least one other display area (col. 8, lines 5-11; displays with different resolutions are disclosed), a boundary wherein the boundary of each display area is at least partially contiguous with the boundary of at least one other display area (fig. 4; col. 6, lines 53-66; the screens are shown being contiguous with each other), and an associated image processor for providing image information data (fig. 5; elements 66 and 68; col. 7, line 66-col. 8, line 11; each screen has its own image processor), and the displayed resolution of the portion of the image displayed on one of the at least two display areas is different than the displayed resolution of the portion of the image displayed on at least one other of the at least two display areas (col. 8, lines 5-11; the displays and graphics cards use different resolutions);

Trueblood discloses an air traffic control display (col. 1, lines 29-44), suggesting that the airspace would appear substantially continuous if the coordinates are mapped the way they are shown in fig. 4, but does not explicitly disclose that the airspace is mapped continuously. Trueblood therefore fails to disclose the display devices being so constructed and arranged such that when a single image is displayed across the at

Art Unit: 2628

least two display areas using image information data received from the associate image processors, the resulting displayed image is perceived as substantially continuous to a viewer situated to view the image, and also an image replicator configured to generate at least two different scale factors to scale the image information data displayed on corresponding ones of the at least two display devices, wherein the image information data is scaled by the at least two different scale factors for display on corresponding ones of the at least two display devices .

Odryna (U.S. Patent 6,333,750), however, discloses, a number of substantially contiguous display devices (see fig. 2 and 3) that display a continuous image (col. 6, lines 22-40; note that in addition to the non-contiguous portions in fig. 1a, continuous portions are displayed in fig. 1b-1c). In addition, Odryna discloses a scaler to scale the data for an appropriate resolution for each display device (col. 20, line 52-col. 21, line 5). It is also noted that Odryna discloses that the display devices may have different resolutions (col. 2, lines 10-26).

Neither Trueblood nor Odryna discloses displaying such that one of scaling, brightness, color and translation of display first and second image data are both within a predetermined tolerance value. Firester (U.S. Patent 6,611,241), however, discloses a multiple display unit with multiple image generators that also includes a sensor for making sure the displays have uniform brightness (col. 5, lines 1-25). This corresponds to a tolerance value of zero for different brightness across the displays.

Trueblood further discloses a third display device (fig. 4) having a third display area with third display resolution, wherein the third display resolution is different from at

Art Unit: 2628

least one of the first display resolution and the second display resolution (col. 8, lines 5-11; col. 11, lines 42-56; a third display with different resolution is disclosed), and a third boundary (fig. 4).

Finally, Trueblood discloses second and third display areas spaced apart with a portion of the first display area interposed therebetween (fig. 4; if it is assumed that screen 3 is the first display, screen 1 is the second display, and screen 4 is the third display, then a portion of the first display- screen 3 is in between the second- screen 1 and the third- screen 4). However, Trueblood does not disclose that the first display area surrounds the second and third display areas, with a portion of the first display interposed therebetween. Gennetten (U.S. Patent 6,812,907) discloses a first display surrounding a second display, but one skilled in the art would not have produced a display with a first part surrounding two other parts, also having that first part *interposed between the two other parts* from the combination of Trueblood and Genetten. Neither reference deals with three displays arranged in this manner and there is no teaching in the references that such an interposition of the first display would be advantageous when the first display surrounds the other two displays. Further, no references combinable with the above references teach show that such an interposition would be known in the art or advantageous.

3. The following is an examiner's statement of reasons for allowance:

4. As to claim 1, the prior art does not teach a 3 display system wherein the first display area surrounds the second and third display areas and second and third display

Art Unit: 2628

areas are spaced apart with a portion of the first display area interposed therebetween along with the other limitations of claim 1. Claims 11 and 22 recite similar limitations.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
